The invention also provides therapeutic methods as well as processes and intermediates useful for preparing compounds of Formula (I). The compounds are useful as 5-HT ligands.

## HEXAHYDROAZEPINO (4,5-G) INDOLES AND INDOLINES AS 5-HT RECEPTOR LIGANDS

## FIELD OF THE INVENTION

The present invention provides tricyclic hexahydroazepinoindole and indoline  
5 derivatives, and more specifically, provides compounds of Formula (I) described  
herein below. These compounds are 5-HT ligands, and are useful for treating diseases  
wherein modulation of 5-HT activity is desired.

## BACKGROUND OF THE INVENTION

10 Serotonin has been implicated in a number of diseases and conditions that  
originate in the central nervous system. These include diseases and conditions related  
to sleeping, eating, perceiving pain, controlling body temperature, controlling blood  
pressure, depression, anxiety, schizophrenia, and other bodily states. (R. W. Fuller,  
Biology of Serotonergic Transmission, ed. Neville V. Osborne, John Wiley and Sons  
15 (1982), p 221; D. J. Boullin, Serotonin in Mental Abnormalities 1, John Wiley and  
Sons (1978), p. 316; J. Barchas, *et al.*, Serotonin and Behavior, Academic Press, New  
York, New York (1973).) Serotonin also plays an important role in peripheral  
systems, such as the gastrointestinal system, where it has been found to mediate a  
variety of contractile, secretory, and electrophysiologic effects.

20 As a result of the broad distribution of serotonin within the body, there is a  
tremendous interest in drugs that affect serotonergic systems. In particular, receptor-  
specific agonists and antagonists are of interest for the treatment of a wide range of  
disorders, including anxiety, depression, hypertension, migraine, obesity, compulsive  
disorders, schizophrenia, autism, neurodegenerative disorders (*e.g.* Alzheimer's  
25 disease, Parkinsonism, and Huntington's chorea), and chemotherapy-induced  
vomiting. (M. D. Gershon, *et al.*, The Peripheral Actions of 5-Hydroxytryptamine,  
246 (1989); P. R. Saxena, *et al.*, Journal of Cardiovascular Pharmacology,  
15:Supplement 7 (1990).)

The major classes of serotonin receptors (5-HT<sub>1-7</sub>) contain fourteen to eighteen  
30 separate receptors that have been formally classified. See Glennon, *et al.*,  
*Neuroscience and Behavioral Reviews*, 1990, 14, 35; and D. Hoyer, *et al. Pharmacol.*  
*Rev.* 1994, 46, 157-203. Recently discovered information regarding subtype identity,

distribution, structure, and function suggests that it is possible to identify novel, subtype specific agents, having improved therapeutic profiles (e.g. fewer side effects).

For example, the 5-HT<sub>2</sub> family of receptors is comprised of 5-HT<sub>2A</sub>, 5-HT<sub>2B</sub>, and 5-HT<sub>2C</sub> subtypes, which have been grouped together on the basis of primary  
5 structure, secondary messenger system, and operational profile. All three subtypes are G-protein coupled, activate phospholipase C as a principal transduction mechanism, and contain a seven-transmembrane domain structure. There are distinct differences in the distribution of the three 5-HT<sub>2</sub> subtypes. The 5-HT<sub>2B</sub> and 5-HT<sub>2A</sub> receptors are widely distributed in the periphery, while the 5-HT<sub>2C</sub> receptor has been found only in  
10 the central nervous system, being highly expressed in many regions of the human brain. See G. Baxter, *et al. Trends in Pharmacol. Sci.* 1995, 16, 105-110.

Subtype 5-HT<sub>2A</sub> has been associated with effects including vasoconstriction, platelet aggregation, and bronchoconstriction, while subtype 5-HT<sub>2C</sub> has been associated with diseases that include depression, anxiety, obsessive compulsive  
15 disorder, panic disorders, phobias, psychiatric syndromes, and obesity. Very little is known about the pharmacological role of the 5-HT<sub>2B</sub> receptor. See F. Jenck, *et al., Exp. Opin. Invest. Drugs*, 1998, 7, 1587-1599; M. Bos, *et al., J. Med. Chem.*, 1997, 40, 2762-2769; J.R. Martin, *et al., The Journal of Pharmacology and Experimental Therapeutics*, 1998, 286, 913-924; S.M. Bromidge, *et al., J. Med. Chem.*, 1998,  
20 41, 1598-1612; G.A. Kennett, *Drugs*, 1998, 1, 4, 456-470; and A. Dekeyne, *et al., Neuropsychopharmacology*, 1999, 38, 415-423.

There is currently a need for pharmaceutical agents that are useful to treat diseases and conditions that are associated with 5-HT receptors.

The following definitions are used, unless otherwise described: halo is fluoro, chloro, bromo, or iodo. Alkyl, alkoxy, etc. denote both straight and branched groups; but reference to an individual radical such as "propyl" embraces only the straight chain radical, a branched chain isomer such as "isopropyl" being specifically referred to. When alkyl or alkylene can be partially unsaturated, the alkyl chain may comprise one or more (e.g. 1, 2, 3, or 4) double or triple bonds in the chain.

Aryl denotes a phenyl radical or an ortho-fused bicyclic carbocyclic radical having about nine to ten ring atoms in which at least one ring is aromatic. Heteroaryl denotes a radical of a monocyclic aromatic ring containing five or six ring atoms consisting of carbon and 1, 2, 3, or 4 heteroatoms each independently selected from the group consisting of non-peroxide oxygen, sulfur, and N(X) wherein X is absent or is H, O, C<sub>1-8</sub>alkyl, phenyl or benzyl, as well as a radical of an ortho-fused bicyclic heterocycle of about eight to ten ring atoms derived therefrom, particularly a benz-derivative or one derived by fusing a propylene, trimethylene, or tetramethylene diradical thereto.

The term "Het" generally represents a non-aromatic heterocyclic group, which can be saturated or partially unsaturated, containing at least one heteroatom independently selected from the group consisting of oxygen, nitrogen, and sulfur. Specific, "Het" groups include monocyclic, bicyclic, or tricyclic groups containing one or more heteroatoms independently selected from the group consisting of oxygen, nitrogen, and sulfur. A "Het" group also can include one or more oxo groups (=O) attached to a ring atom where valency allows. Nonlimiting examples of Het groups include 1,3-dioxolanyl, 1,4-dioxanyl, 1,4-dithianyl, 2*H*-pyranyl, 2-pyrazolinyl, 4*H*-pyranyl, chromanyl, imidazolidinyl, imidazoliny, indoliny, isochromanyl, isoindoliny, morpholiny, piperazinyl, piperidinyl, piperidyl, pyrazolidinyl, pyrazolidinyl, pyrazolinyl, pyrrolidinyl, pyrroliny, quinuclidinyl, thiomorpholiny, and the like.

It will be appreciated by those skilled in the art that compounds of the invention having a chiral center may exist in and be isolated in optically active and racemic forms. Some compounds may exhibit polymorphism. It is to be understood that the present invention encompasses any racemic, optically-active, polymorphic, tautomeric, or stereoisomeric form, or mixture thereof, of a compound of the invention, which possesses the useful properties described herein, it being well known

in the art how to prepare optically active forms (for example, by resolution of the racemic form by recrystallization techniques, by synthesis from optically-active starting materials, by chiral synthesis, or by chromatographic separation using a chiral stationary phase) and how to determine 5-HT activity using the standard tests which are well known in the art.

The carbon atom content of various hydrocarbon-containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety, *i.e.*, the prefix C<sub>i-j</sub> indicates a moiety of the integer "i" to the integer "j" carbon atoms, inclusive. Thus, for example, C<sub>1-8</sub>alkyl refers to alkyl of one to eight carbon atoms, inclusive.

The compounds of the present invention are generally named according to the IUPAC or CAS nomenclature system. Abbreviations which are well known to one of ordinary skill in the art may be used (*e.g.* "Ph" for phenyl, "Me" for methyl, "Et" for ethyl, "h" for hour or hours and "rt" for room temperature).

30 preventing anxiety, obesity, depression, schizophrenia, a stress-related disease (*e.g.* general anxiety disorder), panic disorder, a phobia, obsessive compulsive disorder, post-traumatic-stress syndrome, immune system depression, a stress-induced problem

with the gastrointestinal or cardiovascular system, or sexual dysfunction in a mammal (e.g. a human).

Specifically, the invention also provides the use of a compound of Formula (I) or a pharmaceutically acceptable salt thereof to prepare a medicament for treating or preventing anxiety, obesity, depression, or a stress-related disease in a mammal (e.g. a human).

The invention also provides a method for preparing a compound of Formula (I), wherein R<sup>3</sup> or R<sup>4</sup> is hydrogen comprising deprotecting a corresponding compound of Formula (I), wherein R<sup>3</sup> or R<sup>4</sup> is a suitable nitrogen protecting group.

Compounds of the invention can generally be prepared using the synthetic schemes illustrated in Schemes 1-4. Starting materials can be prepared by procedures described in these schemes or by procedures that would be well known to one of ordinary skill in organic chemistry. The variables used in the Schemes are as defined below or as in the claims.

Compounds of Formula (I) can be prepared by reactions outlined in Schemes 1 to 4. The intermediates used in the synthesis to prepare compounds of Formula (I) can be prepared as illustrated in Schemes 1 and 2, wherein the protecting group (PG) is -COOMe and -Boc, respectively.

Scheme 1

Scheme 1 illustrates the synthesis of intermediates 4 and 6 (PG is COOMe and Boc respectively). Benzoazepine (1) (Pecherer, B. *et al.*, *J. Heterocycl. Chem.*, **9**, 609 (1972)) is protected with methylcarbamate and nitrated under the standard nitration conditions, well known to one skilled in the art of organic synthesis, such as, for example,  $\text{NH}_4\text{NO}_3/\text{H}_2\text{SO}_4$ , to provide a mixture of two regio-isomers 3 and 4, which can be separated by chromatography. Treatment of compound 4 with  $\text{Ba}(\text{OH})_2$  provides intermediate 5, in which the Boc group can be introduced using a standard method (for example,  $\text{Boc}_2\text{O}/\text{Dioxane}$ ).

Scheme 2

Scheme 2 illustrates an alternative method for preparation of intermediate 6. The methoxybenzoazepine 7 (Pecherer, B. *et al.*, *J. Heterocycl. Chem.*, **9**, 609 (1972)) is protected with a trifluoroacetyl group and subsequent demethylation with a Lewis acid such as  $\text{BBr}_3$  to provide hydroxy compound 9, which is converted to the corresponding triflate 10 under the Buchwald/Hartwig conditions (see Yang, B. H. *et al.*, *J. Organomet. Chem.*, **576**, 125 (1999) and Hartwig, J. F., *Angew. Chem., Int. Ed. Engl.*, **37**, 2046 (1998)). The aniline 11 can be formed after reaction of triflate 10 with benzophenone imine followed by acidic hydrolysis. Aniline 11 is oxidized to provide nitro compound 12, and the protecting group is converted to a Boc group to provide compound 6.

Scheme 3

Compounds of Formula (I) can be prepared by the reactions outlined in Scheme 3 (where X is H or O) by constructing the indole ring (see, *Indoles, Best Synthetic Methods* Academic Press, 1999, San Diego, CA). For example, when X is hydrogen and PG is COOMe, the aniline reacts with chloral hydrate and hydroxylamine to form isatin, which is reduced with  $\text{LiAlH}_4$  to form the indole ring. Under the same reaction conditions, the carbamate group is reduced to the methyl group. The aniline can also be transformed to the corresponding hydrazine and then subjected to the Fisher indole synthesis conditions to provide indoles. The aniline can also react with  $\alpha$ -haloaldehydes or ketones to form the corresponding  $\alpha$ -anilino intermediates, which under acidic conditions can lead to the indole formation.

In Scheme 3, compounds where X is oxygen, the nitro compound can be subjected to the Bartoli indole synthesis. (See Bartoli, G. *et al.*, *Tetrahedron Lett.*, **30**, 2129 (1989).) The conditions employed, vinylmagnesium chloride/THF, provide indole **14** ( $\text{R}^1$  and  $\text{R}^2$  are each hydrogen). In compound **15**, when  $\text{R}^1$  is hydrogen, the electrophilic substitution can lead to the introduction of a variety of electrophiles, for example, the acyl and nitro groups and halogens. The compounds of **15**, when  $\text{R}^1$  or  $\text{R}^2$  are halogens, can react with a variety of aryl boronic acids using a palladium catalyst such as, for example,  $\text{Pd}(\text{PPh}_3)_4$ ,  $\text{Pd}_2(\text{dba})_3$ ,  $\text{Pd}(\text{OAc})_2$ , and the like to form the arylated indoles. (See *e.g.*, Miyaura, N. *et al.*, *Chem. Rev.*, **95**, 2457 (1995).) To introduce  $\text{R}^3$  as an aryl (or heteroaryl) group, the reaction is carried out using palladium catalyst such as a palladium dibenzylidene acetone (dba) catalyst

(Pd<sub>2</sub>(dba)<sub>3</sub>) in the presence of base such as sodium *tert*-butoxide or K<sub>3</sub>PO<sub>4</sub> with a variety of aryl or heteroaryl halides or aryl or heteroaryl triflates. (See Old, D. W., *et al.*, Org. Lett., 2, 1403 (2000).)

The R<sup>4</sup> group can be introduced (15 to 16) by starting with cleavage of the protecting groups (*Protective Groups in Organic Synthesis, 2nd Edition*® Greene and Wuts, John Wiley and Sons, Inc, New York (1991)). Then the secondary amine can be derivatized with an alkyl halide or alkyl mesylate in the presence of a base such as triethylamine or sodium carbonate in solvents such as acetonitrile or dimethyl formamide (DMF) (see, *e.g.*, Glennon, *et al.*, Med. Chem. Res., 197 (1996)) or standard reductive alkylation conditions such as treatment with an aldehyde in the presence of sodium cyanoborohydride under acidic conditions using acids such as trifluoroacetic acid (TFA) to provide the R<sup>4</sup>-substituted products. (See for example, Lane, C. F., Sodium Cyanoborohydride - A Highly Selective Reducing Agent for Organic Functional Groups®, Synthesis, 135 (1975).)

Compound 16 can be reduced with sodium cyanoborohydride in an acidic media such as TFA or acetic acid to give the formation of the indoline compound 17.

Scheme 4

Scheme 4 illustrates the manipulations of the R<sup>3</sup> group at the indole nitrogen. The indole nitrogen is alkylated with an alkyl halide or alkyl mesylate in the presence of base such as triethylamine, sodium hydride or sodium (or cesium) carbonate in solvents such as acetonitrile or DMF. (See Glennon, *et al.*, Med. Chem. Res., 197

(1996).) For example, ethyl bromoacetate can be used to form compound **19**, which is selectively reduced with  $\text{LiBH}_4$  to provide alcohol **20**. Mitsunobu reaction with a variety of hydroxy aromatics affords the aryl ether compounds **21**. Deprotection with an acid such as, for example,  $\text{HCl}$ , TFA, or  $\beta$ -chlorocatecholborane, generates the  
5 desired product, **22**. Compound **22** can also be reduced with sodium cyanoborohydride in an acidic media such as TFA or acetic acid to give the formation of the indoline compound **23**.

In cases where compounds are sufficiently basic or acidic to form stable nontoxic acid or base salts, administration of the compounds as salts may be  
10 appropriate. Examples of pharmaceutically acceptable salts are organic acid addition salts formed with acids which form a physiological acceptable anion, for example, tosylate, methanesulfonate, acetate, citrate, malonate, tartarate, succinate, benzoate, ascorbate,  $\alpha$ -ketoglutarate, and  $\alpha$ -glycerophosphate. Suitable inorganic salts may also be formed, including hydrochloride, sulfate, nitrate, bicarbonate, and carbonate  
15 salts.

Pharmaceutically acceptable salts may be obtained using standard procedures well known in the art, for example by reacting a sufficiently basic compound such as an amine with a suitable acid affording a physiologically acceptable anion. Alkali metal (for example, sodium, potassium or lithium) or alkaline earth metal (for  
20 example calcium) salts of carboxylic acids can also be made.

Compounds of the present invention can conveniently be administered in a pharmaceutical composition containing the compound or salt thereof in combination with a suitable excipient. Such pharmaceutical compositions can be prepared by methods and contain excipients which are well known in the art. A generally  
25 recognized compendium of such methods and ingredients is Remington's Pharmaceutical Sciences by E.W. Martin (Mark Publ. Co., 15th Ed., 1975). The compounds and compositions of the present invention can be administered parenterally (for example, by intravenous, intraperitoneal or intramuscular injection), topically, orally, or rectally.

30 For oral therapeutic administration, the active compound or salt thereof may be combined with one or more excipients and used in the form of ingestible tablets, buccal tablets, troches, capsules, elixirs, suspensions, syrups, wafers, and the like. Such compositions and preparations should contain at least 0.1% of active compound.

The percentage of the compositions and preparations may, of course, be varied and may conveniently be between about 2 to about 60% of the weight of a given unit dosage form. The amount of active compound in such therapeutically useful compositions is such that an effective dosage level will be obtained.

5           The tablets, troches, pills, capsules, and the like may also contain the following: binders such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid and the like; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, fructose, lactose or aspartame or a flavoring agent such as  
10   peppermint, oil of wintergreen, or cherry flavoring. When the unit dosage form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier, such as a vegetable oil or a polyethylene glycol. Various other materials may be present as coatings or to otherwise modify the physical form of the solid unit dosage form. For instance, tablets, pills, or capsules may be coated with gelatin, wax, shellac  
15   or sugar and the like. A syrup or elixir may contain the active compound, sucrose or fructose as a sweetening agent, methyl and propylparabens as preservatives, a dye, and/or flavoring such as cherry or orange flavor. Of course, any material used in preparing any unit dosage form should be pharmaceutically acceptable and substantially non-toxic in the amounts employed. In addition, the active compound  
20   may be incorporated into sustained-release preparations and devices.

          The compounds or compositions can also be administered intravenously or intraperitoneally by infusion or injection. Solutions of the active compound or its salts can be prepared in water, optionally mixed with a nontoxic surfactant. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, triacetin,  
25   and mixtures thereof and in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

          Pharmaceutical dosage forms suitable for injection or infusion can include sterile aqueous solutions or dispersions or sterile powders comprising the active ingredient which are adapted for the extemporaneous preparation of sterile injectable  
30   or infusible solutions or dispersions, optionally encapsulated in liposomes. In all cases, the ultimate dosage form should be sterile, fluid and stable under the conditions of manufacture and storage. The liquid carrier or vehicle can be a solvent or liquid dispersion medium comprising, for example, water, ethanol, a polyol (for

example, glycerol, propylene glycol, liquid polyethylene glycols, and the like), vegetable oils, nontoxic glyceryl esters, and suitable mixtures thereof. The proper fluidity can be maintained, for example, by the formation of liposomes, by the maintenance of the required particle size in the case of dispersions or by the use of

5 surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars, buffers or sodium chloride. Prolonged absorption of the injectable compositions can be brought about by the use in the

10 compositions of agents delaying absorption, for example, aluminum monostearate and gelatin.

Sterile injectable solutions can be prepared by incorporating the active compound in the required amount in the appropriate solvent with various of the other ingredients enumerated above, as required, followed by filter sterilization. In the case

15 of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum drying and the freeze drying techniques, which yield a powder of the active ingredient plus any additional desired ingredient present in the previously sterile-filtered solutions.

For topical administration, the present compounds or salts thereof may be

20 applied in pure form, *i.e.*, when they are liquids. However, it will generally be desirable to administer them to the skin as compositions or formulations, in combination with a dermatologically acceptable carrier, which may be a solid or a liquid.

Useful solid carriers include finely divided solids such as talc, clay,

25 microcrystalline cellulose, silica, alumina and the like. Useful liquid carriers include water, alcohols or glycols or water-alcohol/glycol blends, in which the present compounds can be dissolved or dispersed at effective levels, optionally with the aid of non-toxic surfactants. Adjuvants such as fragrances and additional antimicrobial agents can be added to optimize the properties for a given use. The resultant liquid

30 compositions can be applied from absorbent pads, used to impregnate bandages and other dressings, or sprayed onto the affected area using pump-type or aerosol sprayers. Thickeners such as synthetic polymers, fatty acids, fatty acid salts and esters, fatty alcohols, modified celluloses or modified mineral materials can also be employed

with liquid carriers to form spreadable pastes, gels, ointments, soaps, and the like, for application directly to the skin of the user.

Useful dosages of the compounds of Formula (I) can be determined by comparing their *in vitro* activity, and *in vivo* activity in animal models. Methods for the extrapolation of effective dosages in mice, and other animals, to humans are  
5 known to the art; for example, see U.S. Pat. No. 4,938,949.

The compound is conveniently administered in unit dosage form; for example, containing about 0.05 mg to about 500 mg, conveniently about 0.1 mg to about 250 mg, most conveniently, about 1 mg to about 150 mg of active ingredient per unit  
10 dosage form. The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example, as two, three, four or more sub-doses per day. The sub-dose itself may be further divided, *e.g.*, into a number of discrete loosely spaced administrations.

The compositions can conveniently be administered orally, sublingually,  
15 transdermally, or parenterally at dose levels of about 0.01 to about 150 mg/kg, preferably about 0.1 to about 50 mg/kg, and more preferably about 0.1 to about 10 mg/kg of mammal body weight.

For parenteral administration, the compounds are presented in aqueous solution in a concentration of from about 0.1 to about 10%, more preferably about 0.1  
20 to about 7%. The solution may contain other ingredients, such as emulsifiers, antioxidants or buffers.

The exact regimen for administration of the compounds and compositions disclosed herein will necessarily be dependent upon the needs of the individual subject being treated, the type of treatment and, of course, the judgment of the  
25 attending practitioner.

The ability of a compound of the invention to act as a 5-HT receptor agonist or antagonist can also be determined using *in vitro* and *in vivo* assays that are known in the art. The invention provides compounds of Formula (I) that act as either agonists or as antagonists of one or more 5-HT receptor subtypes. The compounds of the  
30 invention are 5-HT ligands, which typically displace >50% of a radiolabeled test ligand from one or more 5-HT receptor subtype at a concentration of 1  $\mu$ M. The procedures used for testing such displacement are well known and would be readily available to one skilled in the art. For example, see L.W. Fitzgerald, et al., *Mol.*

## DESCRIPTION OF PREFERRED EMBODIMENTS

### PREPARATION 1: Preparation of *tert*-butyl 6-nitro-1,2,4,5-tetrahydro-3*H*-3-benzazepine-3-carboxylate:

#### Step a. Methyl 1,2,4,5-tetrahydro-3*H*-3-benzazepine-3-carboxylate

10 A flame-dried, 2-L, three-necked flask was charged with 2,3,4,5-tetrahydro-1*H*-3-benzazepine (95.0 g, 0.645 mol), sodium bicarbonate (108.4 g, 1.29 mol), THF (600 mL), and water (600 mL). The flask was cooled to 0 °C and methyl chloroformate (62.3 mL, 0.81 mol) was added dropwise over 30 min. The bath was removed and the mixture stirred at room temperature for 16 hours. EtOAc was added,

A 2-L, three-necked flask was charged with methyl 1,2,4,5-tetrahydro-3*H*-3-benzazepine-3-carboxylate (132.4 g, 0.645 mol) and sulfuric acid (400 mL). In

extracted first with EtOAc and then with  $\text{CH}_2\text{Cl}_2$ . The organic layers were concentrated and dried over magnesium sulfate to give 59.5 g of an orange oil (37%). The oil was subjected to preparative HPLC and the isomers separated and purified to give pure samples of the title compounds methyl 6-nitro-1,2,4,5-tetrahydro-3H-3-benzazepine-3-carboxylate (1%) and methyl 7-nitro-1,2,4,5-tetrahydro-3H-3-benzazepine-3-carboxylate (20%). **Step c. 6-Nitro-2,3,4,5-tetrahydro-1H-3-benzazepine maleate salt**

6-Nitro-1,2,4,5-tetrahydro-3H-3-benzazepine-3-carboxylate (1.05 g, 4.2 mmol) was dissolved in methanol (3.0 mL) and barium hydroxide octahydrate (6.31 g, 0.020 mol) and water (6.0 mL) were added and the mixture was heated at 100 °C for 16 hours. The mixture was heated at 65°C for 16 hours. The mixture was allowed to cool, ether was added, and the mixture was filtered through celite. The filtrate was concentrated to give 20.8 g of brown oil, combined with a previous lot of the imine intermediate (3.4 g), and subjected to column chromatography (elution with 5-20% EtOAc/heptane). The combined fractions containing the desired compound were collected and concentrated to give 11.8 g of a yellow solid, which was contaminated with benzophenone. The solid was crystallized to give 7.82 g of the imine intermediate as yellow crystals. The mother liquors were subjected to a second column chromatography (elution with 5-20% EtOAc/heptane) to afford an additional 3.37 g of the imine intermediate.

This intermediate (10.27 g, 24.3 mmol) was dissolved in THF (75 mL), HCl (25 mL, 2 N) was added, and the solution was stirred at room temperature for 1 hour. The solution was concentrated and partitioned between HCl (approximately 200 mL 1 N) and hexane:EtOAc (2:1, 400 mL). The aqueous layer was washed with hexane:EtOAc (2:1, 150 mL) to remove the remaining benzophenone impurity. The aqueous layer was then separated and sodium bicarbonate was slowly added with stirring until the pH of the mixture is 7-8. Extraction with  $\text{CH}_2\text{Cl}_2$  (2 X 250 mL) and concentration of the organic layer gives 6.2 g (98%) of the title compound as a clear

### Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 33-35 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
